## SKILLS

Full Stack Developer, React.js, Redux, JavaScript, Python, Flask, HTML5, CSS3, SCSS, SQL, PostgreSQL, SQLAlchemy, Heroku, Github, Docker, Node.js, APIs, RethinkDB, Postgres, Cold Fusion, Next.JS, CFML, Github Copilot, mariaDB

## Sites In Production

Most of the sites I have worked on during my time at Blueriver, have been Apple sites. These sites were mostly for Apple employee use only, therefore you would need access to Apple's VPN to view them. I do sometimes get the opportunity to work on non-apple sites, however, here are a couple which I worked on, developing most of the components used.

**Sparrow** (React.js, Next.js, Mura Content Management System)

[live](#)

- Mura content management system serves as sort of the API, where the administrators can enter content (text/images) or drag/drop entire modules. I was given design mockups of what their site would look like as well as what the draggable modules would be able to do.
- The front end uses Next.js as well as React. I connected React components to the Mura CMS, in order to bring the modules to life. The client wanted several animations, as well as the ability for some modules to become carousels when the screen becomes tablet or smaller. This required a lot of finesse and creative solutions. Something for which I am frequently praised.
- Incorporated CSS media queries to ensure the site would look beautiful no matter if you were on Desktop, Tablet or Mobile device. I have a keen eye for aesthetics and take great pride in ensuring the sites I make look great inside and out.

**Certuiny** (Cold-Fusion, Vanilla Javascript, Mura Content Management System)

[live](#)

- This website uses the Mura CMS, although it is an older version which uses only Cold-Fusion, and Vanilla Javascript. It was a little more difficult to get this to do the more modern features the client requested, however, I made it work.
- Created drag and drop modules, as well as created animations throughout the site, the client enters the content they want and the code I provided automatically formats it the way they envisioned.

## EXPERIENCE

### Application Developer

*Blueriver*

April 2022 - October 2023

- Full stack Software Engineer utilizing a variety of tech stacks. I utilize Docker containers, Javascript/React, Next.js, Cold Fusion on a daily basis.
- Leveraged AI utilizing Github Co-Pilot to be faster and more efficient.
- Apple is Blueriver's largest and most demanding client. As such, I am currently on the Apple team and have developed websites and web apps for them that are currently in use with thousands of daily users. Apple is a company known for their attention to detail, their ease of use, and their simplicity. For them to give the stamp of approval to my work I see as an accomplishment in itself.
- Although I primarily worked on Apple projects at Blueriver, I would also work on other websites that were also clients of Blueriver. Blueriver is a company with many clients, each with their own demands and each having a different code base, these websites were sometimes made by professional or amateur developers. Therefore, each code base is a new challenge, we had to learn their code base, and implement the changes they hired Blueriver to perform. As such, quick learning is a much needed skill, as is transitioning to multiple different projects throughout the month and sometimes throughout the week. This has only served to further sharpen my skills, as I can hit the ground running on pretty much any new project I'm put on.
- Frequently touted as always having user experience in mind, as I always want to ensure the design is easy for the user to follow. Simple is better, and I imagine users want an easy to follow intuitive site to use.
- I started here in a language I was not familiar with, Cold Fusion, which I picked up in record time. Was frequently praised for being such a quick learner, with my leadership team giving me kudos in our company slack channel on a regular basis.
- Was able to seamlessly transition into their tech stack and culture.

*Cisoshare*

Dec 2021 - April 2022

- Full stack application developer. Application had a Node.js with an Express.js backend with a RethinkDB as an API. This database for the API was very similar to Postgres, which I am very familiar with as well, most relational databases are very similar. The front end utilized Javascript/React.js utilizing many MUI components as well as custom React components.
- Created back-end calls to a RESTful API within a Node.js framework utilizing Express with a RethinkDB database, to be utilized on the front-end. Created functional React components in accordance with Sprint specifications and desired functionality.

Incorporating the latest and greatest programming practices, in order for code to be efficient and run at the maximum speed possible.

- Was able to seamlessly transition into their tech stack and culture.

## EDUCATION

### **App Academy** - Feb 2021 | Online

Rigorous 1000-hour immersive full-stack web development course with <5% acceptance rate. Teaches: Python, SQL, JavaScript, ReactJS, ReduxJS, algorithms, TDD, REST, security, Full Stack Applications, design patterns and programming best practices.

### **BA Biology** - University of Nevada, Reno | 2017- 2020 | Not Completed

Took leave to pursue software engineering and enrolled in App Academy
